

Dr. Meghan Riegel
Optometrist

Benefits of an Optomap:

- Early detection of sight-threatening conditions and blindness such as glaucoma, macular degeneration and retinal holes or tears.
- Early detection of life-threatening diseases like Cancer, Stroke and Cardiovascular disease
- A permanent record in your medical file which can provide a baseline for comparison later on to diagnose or track eye conditions.
- Provides a BETTER overall view than dilation, with the ability to magnify and add filters that can uncover subtle retinal abnormalities.
- Immediately review results with your doctor.
- Is as fast as taking a picture.
- **MAY NOT REQUIRE DILATING DROPS**, thus eliminating a 30-minute dilation time in the waiting room, and avoids blurry near-vision and light sensitivity for 2 hours or more after your eye exam.

Early detection means successful treatments can be administered and reduces the risk to your sight and health.

We are proud to have invested in this state of the art technology because we believe that it is in **ALL** our patient's best medical interest to have this retinal scan performed. **The Optomap screening is the standard of care in our practice and is strongly recommended by the doctor. The Optomap screening fee is \$39.**

I acknowledge that I have read and understand the benefits of the Optomap retinal screening.
